

# Leishmaniasis

# Etiology

- **O. Kinetoplastida, Fam. Trypanosomatidae**
- **Dimorphic with 2 main stages:**

<b>Intracellular amastigote</b>	<b>Flagellate promastigote</b>
<b>Round 2 – 6 <math>\mu\text{m}</math> <math>\Phi</math></b>	<b>Long, slender 15 - 30 <math>\mu\text{m}</math> long</b>
<b>Nucleus , kinetoplast, internal flagellum</b>	<b>Central nucleus, kinetoplast , long anterior flagellum</b>
<b>In mononuclear phagocytic system of the mammal host</b>	<b>In intestinal tract of the insect vector (or in culture)</b>

- **Classification revised, based on observable similarities (phenetics) & evolution history**
- **Isoenzyme electrophoresis is the reference technique for classification**

# Sandfly, Diptera, Sub-fam Phlebotominae

# Leishmaniasis

# Life cycle

# Promastigotes and amastigotes of *L. donovani*

**amastigotes in  
macrophage**

# Leishmaniasis

# Geographical distribution

- **Worldwide. Distribution of disease related to the distribution of the sand fly. 12 M cases**

VL	CL
<ul style="list-style-type: none"><li>• <b>47 countries (also in East-Africa)</b></li><li>• <b><i>L. donovani</i> (anthroponotic) is found in China, India, East-Africa</b></li><li>• <b><i>L. infantum</i> (zoonotic) is found in China, Brazil, India</b></li><li>• <b>90% of cases are in India, Bangladesh, Nepal, Sudan, Brazil</b></li></ul>	<ul style="list-style-type: none"><li>• <b>Majority of Old World CL is due to <i>L. major</i> (zoonotic) &amp; <i>L. tropica</i> in Near and Middle East (Afganistan to Syria)</b></li><li>• <b><i>L. major</i> if also found in West, North, East Africa and Central Asia</b></li><li>• <b><i>L. tropica</i> (anthroponotic) is also found in North Africa</b></li><li>• <b><i>L. aethiopica</i> is found in Ethiopia and Kenya</b></li><li>• <b>In the New World, <i>L. braziliensis</i> has a wide distribution then <i>L. mexicana</i> or <i>L. panamensis</i> more restricted.</b></li></ul>

# Leishmaniasis

# Clinical features VL

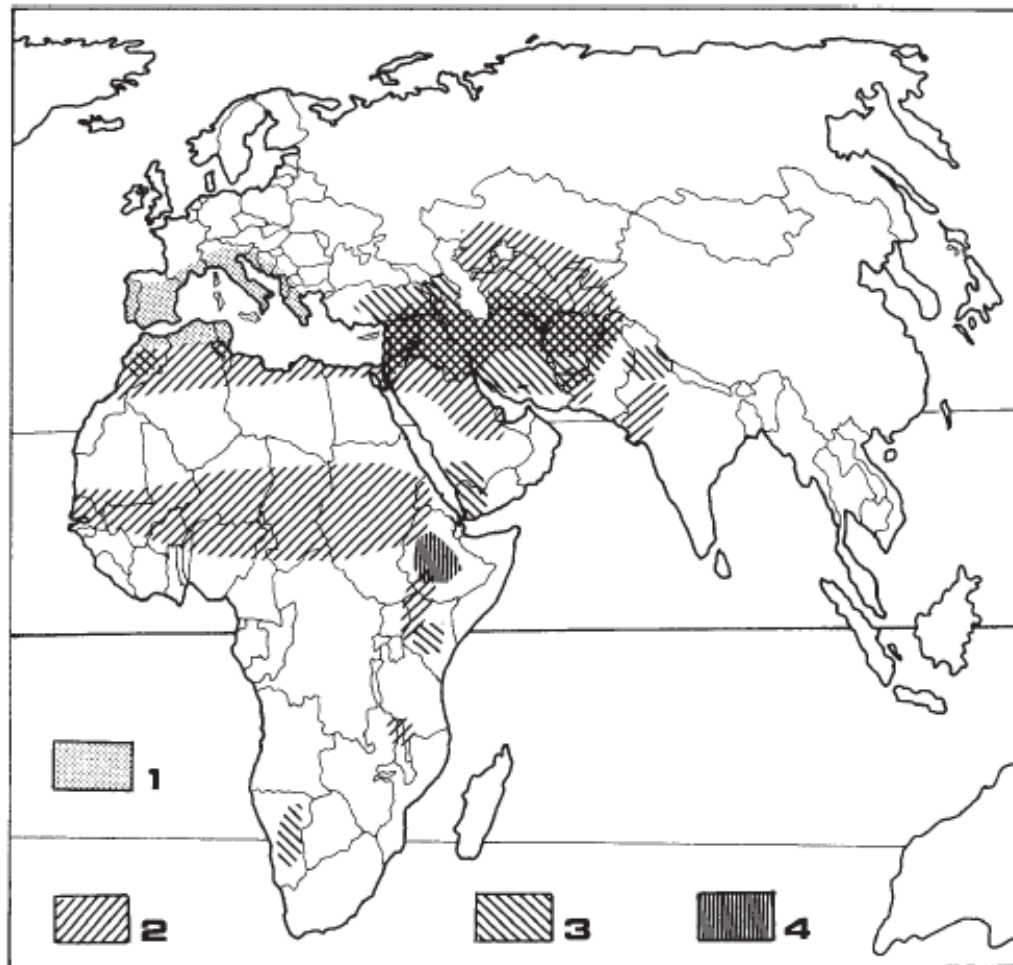

**VL (*L. donovani*, *L. infantum*; *L. archibaldi* in E-Afr)**

- **Incubation period: 2-6 m (10d to 10y!)**
- **Onset: sudden (T°c ↑ , fever for days) or gradual (irregular fever)**

**Then:**

- **Protuberant abdomen**
- **Muscle wasting of limbs**
- **Anaemia, fever, weight loss, splenomegaly, hepatomegaly, adenopathy**
- **In India, grayish skin due to anaemia → kala-azar**
- **Diarrhoea often reported (ulcerations of digestive mucosa)**
- **Pulmonary involvement possible (dry cough)**
- **Epistaxis (nose bleed mostly, sometimes gums)**

# Distribution of Leishmania sp. in the Old World

Geographical distribution of Old World CL. 1, *L. infantum* CL; 2, Zoonotic CL caused by *L. major*; 3, *L. tropica* CL; 4, *L. aethiopica*

# Leishmaniasis

# Clinical features VL

**Then worsening with amplification of all symptoms**

- Ascites are late signs of bad prognosis
- Sometimes oedema/pleural effusion
- Renal involvement may occur (albuminuria)

## Biological parameters: alterations

Haematology	Plasmatic proteins
<ul style="list-style-type: none"><li>• Anaemia (normochromic/normocytic) is intense (Hb levels 7-10g/dL)</li><li>• Leucopenia (<math>1-3000/\text{mm}^3</math>)</li><li>• Severe thrombopenia (<math>\leq 4000/\text{mm}^3</math>)</li><li>• Pancytopenia is commonly associated with VL</li></ul>	<ul style="list-style-type: none"><li>• Inflammation syndrome with raised erythrocytes sedimentation rate and increase of C reactive protein</li><li>• Low albumin levels</li><li>• Hypergammaglobulinaemia (over production of IgG mostly)</li></ul>

# Cutaneous leishmaniasis

# Mucocutaneous leishmaniasis: 'tapir nose'.

(From Manson's Tropical Diseases, 22<sup>nd</sup> edition)

# Mucocutaneous leishmaniasis

# Leishmaniasis

# Diagnosis 1

- **Based on clinical presentation, epidemiology but confirmed by direct detection of parasites or presence of specific Ab**
- **Sample collection:**

VL	CL & MCL
<ul style="list-style-type: none"><li>• Bone marrow/ spleen aspiration</li><li>• Splenic puncture</li><li>• Lymph node aspiration</li><li>• Parasite detected in peripheral blood</li></ul>	<ul style="list-style-type: none"><li>• Skin material by superficial scraping, needle aspiration or biopsy punch</li><li>• Site is important &amp; depends on the clinical type of lesion</li></ul>

- **The collected material can be smeared on slide, cultures, fixed or used for PCR**
- **Staining used is May Grünwald- Giemsa**

# Leishmaniasis

## Diagnosis 2

- **Direct observation: sensitivity is low**
- **Culture in blood agar NNN: higher sensitivity & allows for parasites identification by isoenzymes electrophoresis, mononuclear Ab, specific probes**
- **Recent: molecular diagnosis (detection of parasite DNA through PCR. High sensitivity, high specificity**
- **Immunological diagnosis:**
  - **In VL, DCL: humoral response → high level of specific Ab in serum. May be absent in immunocompromised**
  - **In CL, MCL: cell-mediated → delayed hypersensitivity test → several tests \*\*\***

# Leishmaniasis

# Treatment 2

- Treatment according to clinical features. Case to case!

TYPE	MANAGEMENT/TREATMENT
VL	<p>Tx as soon as diagnostic is made</p> <p>Mainly antimonials &amp; Amphotericin B</p> <p>Correct nutritional deficiencies if anaemia &amp; wasting</p> <p>BUT resistance to antimonials. Combinations of drugs not tested yet</p> <p>Leishmaniasis in HIV + is non responsive to drugs &amp; more side effects</p>
LCL	<p>Mild forms: untreated (<i>L. major</i>, <i>L. peruviana</i>) or local antimonials</p> <p>Large lesions: antimonials (20d)</p>
DCL	<p>Once established, resistant to Tx</p> <p>Antimonials may improve evolution for a while</p> <p>Need for tests of new formulations</p>
MCL	<p>Tx of primary lesions with antimonials (20d)</p> <p>Tx fast to avoid mutilations</p> <p>Amphotericin B used but few reports</p>
